P-102 Process Diagram and Tag Relationships

Document ID: APEL-DRG-P102-010 | Owner: Process Engineering | Revision: 1.6

The synthetic feed path connects crude storage to CDU-4.

Flow sequence

• T-401 → XV-410 → P-102 suction → P-102 discharge → CDU-4 feed header.

Instrumentation

P-102 uses distinct tags for pressure, temperature and flow.

Tag register

Tag	Purpose
PT-102	P-102 discharge pressure
TT-102	P-102 discharge temperature
FT-210	Crude flow
PSV-102	Pressure protection

Isolation

Maintenance requires process and electrical isolation.

Boundary

- Suction isolation
- Discharge isolation
- M-102 electrical isolation
- Drain/vent controls where required

Protection

The relief setting and operating limit serve different purposes.

Values

- Operating maximum 40 bar.
- PSV set 47.5 bar.
- Design pressure 50 bar.

Governance

The diagram is synthetic and intended for tag-relationship retrieval.

Limitations

- Not an engineering-for-construction drawing.
- Not a replacement for a controlled plant P&ID.;
- Relationships are synthetic but internally consistent.
